

41. Implement Post.text and Post.points columns

#typeorm #entity #graphql #backend

Add text column to Post entity

- This column will hold the body text of the `post`

/entities/Post.ts

```
@Field()  
@Column()  
text!: string;
```

Add points column to Post entity

- This column will hold the upvotes of the `post`

/entities/Post.ts

```
@Field()  
@Column({ type: int, default: 0 })  
points!: number;
```

Delete old posts

- You might need to delete old posts to update the DB, otherwise it can give errors
- To do that
 - Disable `synchronisation` in `createConnection()` in `index.ts`
 - And again, in `index.ts`, after `await conn.runMigrations();`, we add `await Post.delete({}); //delete all posts` and restart the server
